

Running an application:

1.Switch to the z/OS Projects perspective.

2.Define a launch configuration that includes specific environment variables or input parameters for the executable file.

- On the workbench toolbar, click the **Run** icon and select **Run**.
- In the configurations list, click **Compiled Application**, and then click the **New launch configuration** icon.
- In the **Name** field, type a name for the launch configuration. This name is added to a list of options under a **Run with Configuration** menu. Choose a name that you can associate with the program, input parameters, and environment variable values that are defined in the launch configuration
- On the **Main** tab, define the **Project**, **Program name**, and **Program** parameters in the respective fields.
- On the **System Environment** tab, specify values for environment variables that the executable file queries at runtime.
- On the **Common** tab, define the type of launch configuration and the perspective you want to use for each launch mode.

3. Click **Apply** and **Close**.

4. Run the program.

- In the Projects view, find the executable file that you want to run.
- Right-click the executable file and select **Run with Configuration > (launch configuration name you defined previously)**.
